

KUBECA Website Handoff Summary

Current text, structure, investor-room flow, interactions, assets, and review questions for a follow-up analysis agent.

Generated from the current project state in /home/sabrina/website/FoundationModel.

Purpose

This document summarizes the current KUBECA website structure, narrative, page copy, Investor Room chapters, interactions, assets, and open review questions. It is intended as a handoff brief for another agent or reviewer to analyze what should be added, removed, clarified, or redesigned next.

Current strategic arc:

Problem -> System -> Products -> Markets -> Proof -> Capital -> Contact

Current visual arc:

Image-led problem opening -> System explanation -> Product architecture -> White market/proof/finance sections -> Modern contact close

Current Public Website

Metadata / access description:

KUBECA builds mission intelligence for supervised autonomous aerial systems.

Main header:

KUBECA

Investor Room

Hero:

Eyebrow: AUTONOMOUS AERIAL INTELLIGENCE

Heading: One mission system for coordinated aerial autonomy.

Supporting copy: KUBECA connects carrier platforms, local drone teams, spatial intelligence, and human oversight into one supervised system.

Hero image: assets/images/kubeca/Kubecafixed.png

Public scroll story label:

THE SYSTEM SHIFT

Story scene 1:

Title: THE BOTTLENECK

Copy: More drones do not create autonomy. Without shared context and coordination, aerial assets remain disconnected tools.

Image: assets/images/kubeca/homepage/swarm.png

Story scene 2:

Title: THE SYSTEM LAYER

Copy: KUBECA connects reach, deployable local sensing, spatial understanding, and operator control in one supervised mission architecture.

Image: assets/images/kubeca/kubeca-system-multi.png

Story scene 3:

Title: THE FIRST CONFIGURATION

Copy: Phase 1 begins with an integrated aerial configuration: carrier platform, local drone teams, mission intelligence, and supervised handover.

Image: assets/images/kubeca/kubecaquadcopter.png

Homepage CTA:

Label: Investor Room

Heading: Review the mission system.

Copy: Explore the problem, integrated system, product architecture, validation path, and investment opportunity.

Action: Enter Investor Room

01 / WHY THIS MATTERS

- Limited Reach
- Fragmented Control
- Broken Continuity

02 / THE KUBECA SYSTEM

- The KUBECA System
- Carrier + Relay Layer
- Local Autonomous Drone Teams
- Mission Intelligence Layer
- Shared Spatial Data
- Human-in-the-Loop Control

03 / OUR PRODUCTS

- Carrier Platform
- Mission Modules
- Local Drone Teams
- Mission Software

04 / WHERE KUBECA CREATES VALUE

- Defense / Tactical ISR
- Disaster Response / Search Operations
- Critical Infrastructure Security

05 / FIELD VALIDATION

- Built From Real System Development

06 / INVESTOR ROADMAP

- Capital Staged Around Risk Reduction

07 / CURRENT INVESTMENT FOCUS

- Pre-Seed / Prototype Round

08 / CONTACT

- Contact The Team

01 / WHY THIS MATTERS

Role: Defines the missing-system problem. This chapter should stay image-led and emotional, with a dark photographic hero background and three white supporting cards.

Headline:

AERIAL ASSETS FAIL TO SCALE WHEN THEY CANNOT WORK AS ONE SYSTEM.

Supporting copy:

Small drones provide local detail, but lack reach. Carrier platforms provide distance, but not autonomous coordination. Operators are left connecting feeds, maps, telemetry, and decisions under pressure.

Thesis:

The bottleneck is not more drones.

It is the missing mission intelligence layer between reach, local sensing, software, and human control.

Card 01 / LIMITED REACH:

Small drones create valuable local intelligence, but lose endurance, payload, and connectivity far from the operator.

Image: [assets/images/kubeca/why-matters/limited-reach.png](#)

Card 02 / FRAGMENTED CONTROL:

Carrier systems, drone feeds, maps, telemetry, and decisions remain separated across tools, increasing operator workload.

Image: [assets/images/kubeca/why-matters/fragmented-control.png](#)

Card 03 / BROKEN CONTINUITY:

Terrain, buildings, RF disruption, and degraded infrastructure break the mission picture between assets and operators.

Image: [assets/images/kubeca/why-matters/broken-continuity.png](#)

02 / THE KUBECA SYSTEM

Role: High-level answer to the problem. This explains the integrated mission-system concept before product details.

Label:

02 / THE KUBECA SYSTEM

Heading:

FROM CARRIER PLATFORM TO HUMAN-SUPERVISED AUTONOMOUS MISSION SYSTEMS.

Intro copy:

KUBECA combines long-range carrier deployment, local drone teams, mission intelligence, and human oversight into one coordinated mission system. The key difference is not a single drone, but the system layer that keeps reach, local understanding, and operator control connected throughout the mission.

Carousel slide 01 / CARRIER AT RANGE:

The carrier platform moves local drone teams beyond normal range and maintains a resilient relay link for mission continuity.

Image: [assets/images/kubeca/system/carrier.png](#)

Carousel slide 02 / DEPLOYABLE SCOUT AGENTS:

Local drone teams explore, map, and sense close to the objective, generating the spatial context that raw video alone cannot provide.

Image: [assets/images/kubeca/system/scout-agents.png](#)

Carousel slide 03 / OPERATOR IN CONTROL:

Mission intelligence transforms distributed sensor data into actionable answers, while operators supervise autonomy, confirm decisions, and intervene when needed.

Image: [assets/images/kubeca/system/operator-control.png](#)

Future teaser:

The first configuration is aerial. Over time, the same mission intelligence layer is designed to connect future ground robots and additional autonomous assets across air and ground.

03 / OUR PRODUCTS

Role: Concrete product architecture. This explains what is being built and how the system can become a platform.

Label:

03 / OUR PRODUCTS

Heading:

Modular mission system. One supervised platform.

Overview copy:

KUBECA combines a standardized carrier platform, modular mission payloads, local drone teams, and mission software into one configurable autonomy system.

Phase framing:

Phase 1 validates the core aerial configuration. The architecture is designed to expand through reusable platforms, modular mission capability, and one supervised software layer.

Product view 01 / Carrier Platform:

Positioning: The reach layer.

Core message: A standardized fixed-wing carrier extends range, maintains connectivity, and carries mission-specific modules without redesigning the base airframe.

Rows:

- Core Role: Extend range, maintain connectivity, support local drone deployment.
- Configurable With: Relay, sensor, release, communication, and hybrid mission modules.
- Why It Matters: One reusable platform supports multiple mission types without redesigning the airframe.

Image: assets/images/kubeca/products/carrier-platform.png

Product view 02 / Mission Modules:

Positioning: The configurable mission layer.

Core message: Mission capability changes through interchangeable modules, not a new aircraft for every use case.

Rows:

- Relay Module: Extends communication between operators and mission assets.
- Sensor Module: Adds EO, thermal, mapping, or awareness payloads.
- Release Module: Carries and deploys local drones near the mission area.
- Hybrid Module: Combines relay, sensing, and deployment in one setup.

Image: assets/images/kubeca/products/mission-modules.png

Product view 03 / Local Drone Teams:

Positioning: The close-area intelligence layer.

Core message: Deployable drone teams operate near the objective to explore, map, sense, and provide local context.

Rows:

- FPV: Direct control for immediate operator-led tasks.
- Assisted: Stabilized navigation and guided sensing support.
- Autonomous Scout: Local exploration and spatial context generation.
- Coordinated Team: Multiple assets working from shared mission intent.

Image: assets/images/kubeca/products/local-drone-teams.png

Product view 04 / Mission Software:

Positioning: The coordination layer.

Core message: Mission software converts maps, feeds, asset state, and operator decisions into one supervised mission picture.

Rows:

- Live Mission Map: Tracks assets, routes, zones, and mission progress in real time.
- Building Intelligence: Structures cleared, unknown, and attention areas inside buildings.
- Feed Fusion: Combines drone video, mapping, and sensor context.
- Operator Control: Supports supervision, tasking, confirmation, and intervention.

Image: assets/images/kubeca/products/mission-software.png

Future Connected Assets:

The mission intelligence layer is designed to connect additional autonomous assets over time. Future ground robots can extend local sensing, indoor exploration, rubble access, relay coverage, and perimeter missions within the same supervised system.

Platform statement:

The carrier and local drones are the first configuration. The platform is the mission intelligence layer that can coordinate future assets across air and ground.

04 / WHERE KUBECA CREATES VALUE

Role: Market opportunity. This page shows where the platform can matter, while distinguishing first validation from expansion markets.

Label:

04 / WHERE KUBECA CREATES VALUE

Heading:

WHERE KUBECA MAKES AN IMPACT.

Supporting copy:

KUBECA is built for missions where range, access, and coordination determine operational outcomes.

The system delivers mission-relevant spatial intelligence when visibility is limited and decisions depend on structured spatial context.

Market 01 / INITIAL FOCUS / DEFENSE / TACTICAL ISR:

Long-range reconnaissance, deployable local sensing, and supervised situational awareness in contested and high-risk environments.

Image: assets/images/kubeca/markets/defense-tactical-isr.png

Market 02 / ADJACENT APPLICATION / DISASTER RESPONSE / SEARCH OPERATIONS:

Rapid assessment of damaged or inaccessible areas, local mapping, and safer information gathering before responders enter.

Image: assets/images/kubeca/markets/disaster-response-search.png

Market 03 / PLATFORM EXPANSION / CRITICAL INFRASTRUCTURE SECURITY:

Inspection, perimeter awareness, and coordinated autonomous sensing across complex sites and critical assets.

Image: assets/images/kubeca/markets/critical-infrastructure-security.png

Focus strip:

ONE MISSION INTELLIGENCE LAYER.

EXPANDABLE ACROSS HIGH-NEED MISSIONS.

First validation path:

Aerial Defense / Tactical ISR

Future reach:

Disaster response and critical infrastructure security

05 / FIELD VALIDATION

Role: Proof of capability. This chapter must clearly separate prior team track record from KUBECA-owned products.

Label:

05 / FIELD VALIDATION

Heading:

BUILT FROM REAL AUTONOMOUS SYSTEM DEVELOPMENT.

Intro copy:

KUBECA is founded on hands-on team experience across unmanned systems development, autonomy software, field testing, operator feedback, and defense-relevant system environments.

This prior team experience directly informs the KUBECA mission-system architecture.

Hero image:

assets/images/kubeca/validation/fabric.png

Proof row 01 / FULL SYSTEM DEVELOPMENT:

Team experience leading complete development cycles from concept to deployment: hardware design, component sizing, flight-stack integration, software architecture, hardware/software testing, field iteration, and deployment support.

Proof row 02 / MISSION-READY UAS INTEGRATION:

Prior team experience integrating defense-relevant unmanned aerial systems with proprietary hardware, flight software, payload systems, and mission-relevant platform behavior into functional field-ready systems.

Proof row 03 / GNSS-DENIED AUTONOMY:

Prior team development work in a SPRIND autonomous systems challenge, including SLAM, local mapping, GNSS-denied navigation, scene-graph based spatial understanding, autonomy-stack integration, and system-level software development.

Proof row 04 / FIELD TESTING & OPERATIONAL EXPOSURE:

Prior team work included systems deployed in Ukraine and systems presented and flight-tested at the NATO Mountain Warfare Centre of Excellence. Tactical drone deployment presentation delivered; Challenge Coin awarded.

Proof row 05 / DEFENSE ECOSYSTEM EXPERIENCE:

Team experience includes Bundeswehr-related working groups, discussions with the German Army Concepts and Capabilities Development Centre, collaboration with firms advising the Bundeswehr, industry trade fair representation, and operator feedback.

How We Build:

BUILD EARLY. TEST IN THE FIELD. ITERATE FROM OPERATOR FEEDBACK.

Proven hardware development, autonomy software, and operational feedback are applied through usable prototypes, real constraints, and fast hardware-software iteration.

Next step:

THE NEXT STEP IS THE FIRST INTEGRATED KUBECA MISSION-SYSTEM DEMONSTRATION.

06 / INVESTOR ROADMAP

Role: Financing logic. This page frames capital as milestone-led risk reduction.

Label:

06 / INVESTOR ROADMAP

Heading:

Capital staged around risk reduction.

Subline:

KUBECA raises against measurable milestones: hardware validation, repeatable pilot systems, and a verification pathway toward regulated scale.

Capital roadmap:

Phase 01 / Pre-Seed / Prototype / Indicative Raise: EUR 2-4M

Primary unlock: Integrated carrier-enabled hardware demonstration and partner evaluation units.

Risk reduced: Technical integration risk.

Phase 02 / Seed / Pilot Production / Indicative Raise: EUR 8-15M

Primary unlock: Repeatable pilot systems, Mission Intelligence v1, and early partner validation.

Risk reduced: Production, market, and verification risk.

Phase 03 / Series A / Regulated Scale / Indicative Raise: EUR 25-50M

Primary unlock: Verification package, certification pathway, and scalable autonomous mission-system production.

Risk reduced: Regulatory and scale risk.

Investment logic:

Each round reduces a different class of risk. Phase 1 proves the integrated system in hardware. Phase 2 makes it repeatable and pilot-ready. Phase 3 prepares verification, certification pathways, and regulated scale.

Closing line:

The roadmap is not about building another drone. It is about proving a supervised autonomous mission system step by step.

07 / CURRENT INVESTMENT FOCUS

Role: Current round. This explains what the planned Pre-Seed / Prototype round funds and how it connects to the current starting point.

Label:

07 / CURRENT INVESTMENT FOCUS

Heading:

Pre-Seed / Prototype Round

Subline:

KUBECA is preparing an indicative EUR 2-4M Pre-Seed / Prototype round to validate the carrier-enabled mission system in hardware, build partner evaluation units, and prepare the transition to pilot production.

Phase 1 Starting Point:

The current round does not begin from zero. It builds on proven team capability and tangible KUBECA carrier-platform progress, while funding the integration and validation work required for a complete supervised mission-system demonstration.

Status matrix:

1. Carrier Platform Design / COMPLETED

Current status: Carrier-system CAD design completed and prototype chassis built.

Next validation step: Integrate mission hardware, relay architecture, and deployment mechanism.

2. Autonomous Carrier Flight / DEMONSTRATED

Current status: First autonomous flight of the long-range carrier platform completed successfully.

Next validation step: Expand testing toward integrated mission-system operations.

3. GNSS-Denied Autonomy / EARLY DEMONSTRATION

Current status: GNSS-denied functionality demonstrated in a short test scenario.

Next validation step: Field-test under representative mission constraints.

4. Carrier GNSS-Denied Integration / IN PROGRESS

Current status: Integration into the carrier-system development path is underway.

Next validation step: Validate within the integrated aerial configuration.

Phase 1 close:

Phase 1 converts proven capability and current carrier-platform progress into an integrated KUBECA mission-system demonstration.

Round snapshot:

- Target Range: Indicative EUR 2-4M
- Runway: 18-24 months
- Structure: To be finalized with a lead investor; equity or convertible instrument considered
- Primary Proof Point: Integrated hardware demonstration and partner evaluation readiness
- Capital Unlock: Technical proof, evaluation units, and pilot-production readiness
- Main Risk Reduced: Technical integration risk

Indicative use of funds:

- Engineering & Hardware: 45-55%. Carrier chassis, release mechanism, relay architecture, and local drone redesign.
- Testing & Validation: 15-20%. Ground tests, flight tests, GNSS-denied field validation, partner evaluation units, and field iteration.
- Software Integration: 10-15%. Telemetry, operator workflow, asset tracking, and mission intelligence prototype.
- Team & Operations: 10-15%. Core hires, contractors, supplier coordination, workshop, and operations setup.
- Verification / Documentation: 5-10%. Test evidence, safety documentation, and regulatory pathway preparation.

Closing statement:

Capital is focused on hardware validation, controlled testing, and evidence required for pilot production.

08 / CONTACT

Role: Final conversion. Current treatment is a modern dark contact reveal rather than a full form.

Label:

08 / CONTACT

Heading:

DISCUSS THE KUBECA SYSTEM.

Lead copy:

Connect with the team to discuss the mission intelligence architecture, strategic partnerships, or an investment conversation.

Reveal action:

Contact the team ->

Revealed content:

Investor and strategic partnership conversations

contact@kubeca.com

Current design decision:

The site currently uses a simple native reveal/contact moment instead of a form. This keeps the private preview focused and avoids a heavy form UI. A future version could add a calendar link, secure investor request form, or data-room access flow if needed.

Interaction Model

Investor Room injection:

The Investor Room is built dynamically from the navigation menu. Opening the panel renders all chapters into one long-scroll page, then scrolls to the requested chapter.

System carousel:

- Three slides.
- Manual previous/next controls.
- Numbered selectors.
- Autoplay every six seconds.
- Pauses on hover, focus, and interaction.
- Cleans up timers when the panel closes or rerenders.

Product deck:

- Four manually selectable product tabs.
- Updates hidden state, active classes, aria-selected, aria-hidden, and tabindex.
- Keyboard navigation supports arrow keys, Home, and End.

Contact:

- Uses a native details/summary reveal pattern.
- No backend form submission is currently implemented.

Asset Map

Homepage:

- assets/images/kubeca/Kubecafixed.png
- assets/images/kubeca/homepage/swarm.png
- assets/images/kubeca/kubeca-system-multi.png
- assets/images/kubeca/kubecaquadcopter.png

Why This Matters:

- assets/images/kubeca/why-matters/limited-reach.png
- assets/images/kubeca/why-matters/fragmented-control.png
- assets/images/kubeca/why-matters/broken-continuity.png

System carousel:

- assets/images/kubeca/system/carrier.png
- assets/images/kubeca/system/scout-agents.png
- assets/images/kubeca/system/operator-control.png

Products:

- assets/images/kubeca/products/carrier-platform.png
- assets/images/kubeca/products/mission-modules.png
- assets/images/kubeca/products/local-drone-teams.png
- assets/images/kubeca/products/mission-software.png

Markets:

- assets/images/kubeca/markets/defense-tactical-isr.png
- assets/images/kubeca/markets/disaster-response-search.png
- assets/images/kubeca/markets/critical-infrastructure-security.png

Validation:

- assets/images/kubeca/validation/fabric.png

Current Design Rhythm

Current intended rhythm:

1. Image-led problem opening.
2. System explanation.
3. Product architecture deck.
4. White editorial market section.
5. White proof chapter with authentic hero image and proof rows.
6. White financing memo pages.
7. Modern dark contact close.

Current design concerns to review:

- Product and System can feel visually repetitive if both are too dark or too card-heavy.
- Finance pages are credible, but may need tighter spacing to feel less long.
- Validation has strong proof copy, but legal/strategic review should confirm all named claims are safe for private investor disclosure.
- The homepage should remain a bridge, not duplicate the full investor deck.

Open Questions For The Next Agent

1. Is the Investor Room too long, or is the full long-scroll story appropriate for a private investor preview?
2. Should System and Products remain visually different, or should they become one unified dark technology block?
3. Does the Product chapter clearly distinguish Phase 1 from future platform expansion?
4. Should the Future Connected Assets statement be shorter to avoid over-claiming ground robots?
5. Are the Field Validation claims legally safe and correctly attributed as prior team experience?
6. Should Contact remain a reveal with email, or become a structured form/calendar/data-room request flow?
7. Should Roadmap and Current Investment Focus stay separate, or be combined into one financing chapter?
8. Does the market section need a fourth future market, or is three cleaner and more credible?
9. Does the homepage explain mission intelligence clearly enough for someone who has not opened the Investor Room?
10. Are any legacy unused data entries or old CSS variants still in the code and worth removing for maintainability?

Appendix: Chapter Order

No.	Chapter	Role
01	Why This Matters	Problem and bottleneck
02	The KUBECA System	Integrated system answer
03	Our Products	Product architecture
04	Where KUBECA Creates Value	Market opportunity
05	Field Validation	Verified team track record
06	Investor Roadmap	Staged capital plan
07	Current Investment Focus	Current round and use of funds
08	Contact	Conversion / contact
